                                                                                                                                                                              The present invention describes a restriction primer for eukaryotic short interspersed repeated sequences (SIME), which has one or more additional bases that are a mismatch to, or are unrelated to, the 3'-terminal end of the SINE. The annealing temperature of the primer to the DNA sequence is kept higher than the fusion temperature of the primer during polymerase chain reaction (PCR). The PCR fragments obtained are subjected to electrophoresis to obtain a fingerprint. By comparing the polymorphs from the electrophoresis band pattern, eukaryotic individuals are distinguished. The primer is used for amplifying a eukaryotic deoxyribonucleic acid (DNA) sequence, pinched between SIME sequences by polymerase chain reaction (PCR) fingerprinting. In particular it may be used individual identification of humans for medical and legal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (approximately 10 ng in mass) can be used for individual discrimination of eukaryotes using the primer in a polymerase chain reaction (PCR).

AAZ25143 to AAZ25191 represent specifically claimed examples of primers
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human short interspersed repetitive element PCR primer #5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; short interspersed repetitive element; SINE; PCR; primer; Oncorhynchus; restriction primer; short interspersed repeated sequence; eukaryote; restricted polymerase chain reaction fingerprinting;

                                                                                                                                                                                                                                                                                             The invention relates to human leucine zipper protein 11.99 (AAM49285) and to nucleic acids encoding it (ABL55389). The protein has a molecular weight of 12 kD. The invention also relates to a method for the recombinant production of the protein, an antagonist of the protein, and the use of the protein, gene and antagonist in therapeutic applications. Leucine zipper protein 11.99 can be used in the treatment of a variety of diseases such as embryonic development disorders and tumours. Sequences ABL55399-ABL55370 represent reverse transcription-PCR (RT-CR) primers and the control of the protein 11.99 can be used in the treatment of a variety of the protein as embryonic development disorders and tumours. The polypeptid useful for treating various diseases, such as malignant tumours, nosohaemia, HIV infection, immunological diseases and inflammatory diseases. The invention also provides an antibody against the polypeptide. The present sequence is a primer used to amplify a polynucleotide encoding the polypeptide of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    genotyping; allele
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Solute carrier family 6 neurotransmiter transporter; sectonin genotyping; allele specific oligonucleotide; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   31
```

The present invention relates to a polymorphic variant of a reference sequence for the solute carrier family 6 neurotransmitter transporter, serotonin member 4 (SLC6A4) gene or a fragment of it or a sequence complementary to the first sequence. The invention is used in producing recombinant organism that can be used to express SLC6A4 for protein structure analysis and binding studies. A composition comprising a

structure analysis and binding studies. A congenetyping oligonucleotide is used to detect

a polymorphism

'n

the SLC6A4

ρ.

                                                                                                                                                                                                                                      The invention relates to a novel method for extracting intact cytoplasmic biomolecules from cells. The method of the invention is useful for extracting or acquiring cytoplasmic biomolecules such as proteins or nucleic acids which include cytoplasmic RNA, nuclear and mitochondrial RNA, nuclear and mitochondrial DNA, cytoplasmic mRNA, or their combinations from cells. The method is useful in cancer screening, selecting and monitoring for chemotherapy treatment or cancer recurrence. This type of cell analysis is useful in cancer diagnostics. The method is useful in profiling cells isolated from tissues or body fluids and serves as an adjunct to clinical diagnosis of diverse carcinomas including early stage detection and classification of circulating tumour cells. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ADC79601 standard; DNA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          primer; primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human p53 forward RT-PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Extracting intact cytoplasmic biomolecules e.g. proteins, nucleic from cells, by treating sample comprising cells containing target with permeabilizing agents to release biomolecules and recovering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     26-OCT-2001; 2001US-0330669P 04-APR-2002; 2002US-0369945P

                                                                                                                                                                                                                                                                                                                   S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC in a test subject, by obtaining a sample having a mixed cell population CC in a test subject, by obtaining a sample having a mixed cell population CC suspected of containing cancer cells of epithelial origin, mixing the CC sample with immunomagnetic particles which bind specifically to the CC cancer cells, subjecting the mixture to produce a separated cell CC cancer cells. The method is useful for diagnosing the severity of a CC cancer cells. The method is useful for diagnosing the severity of a CC presence of circulating cancer cells. The test subject is for assessment of a CC cancer cells. The test subject is for assessment of a CC cancer cells. The test subject is subject response to cancer CC cancer cells. The test subject has been diagnosed with a cancer selected from prostate cancer, breast cancer, colon cancer apudoma, choristoma, CC braichoma, malignant carcinoid syndrome, carcinoid heart disease, and CC carcinoma e.g. Walker, basal cell, basosquamous, Brown-Pearce, ductal, CC chis sequence represents a primer used to amplify a specific gene cDNA corcer in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                                                            Ś
                                                                                                                                                                                                                                                                                                                                         containing-1 (SORBS1) gene. The method or determining the containing-1 (SORBS1) gene. The method comprises determining the containing-1 (SORBS1) gene or more positions chosen from 220; 249; -7 with respect to exon 5; -25 with respect to exon 10; +69 with respect to exon 11; +33 with respect to exon 12; and 2337. The invention also discloses primer sequence by amplification and sequencing of the gene. The method is useful for associating one or more SORBS1 SNPs with an insulin disorder e.g. type 2 diabetes, obesity, hypertension, atherosclerosis or metabolic syndrome. The presence or absence of the SNP may be useful in determining whether an individual is at increased or decreased risk for an insulin disorder. The SNPs were identified by screening all of the exons, and 50-150 base pairs of the flanking regions of the introns of the SNP in the human SORBS1 gene. The present sequence represents a sequencing primer used to sorder the human SORBS1 gene.

```
CC hybridization selection, and comprises: (a) providing several DNA CC fragments, at least one of which contains an ITR sequence, a region of the DNA fragment which contains at least one repeat unit consisting of a CC sequence of five, six or seven bases repeated in tandem at least two contains; the description of the providing a stationary support having at least one cC cligonucleotide associated with it, where the oligonucleotide includes a cC sequence of nucleotides which is complementary to a portion of the ITR cc sequence, and (c) combining the DNA fragments with the support under CC conditions where the DNA fragments including the DNA fragment containing the ITR sequence hybridize to the support. The method is particularly used to isolate DNA containing pentanucleotide tandem repeat sequences as cell as to detect target ITR DNA sequences having a low incidence of CC stutter artifacts (no more than 2.4%). The method is useful in DNA CC profiling for linkage analysis, criminal justice, paternity testing and CC the lineage of horses, dogs and other prize animals. The invention CC profiling. The method can detect polymorphisms with a low incidence of Stutter artifacts, which has previously been a problem in interpreting CC allelic content of loci. The development of markers based on larger repeat units, enables easier separation of the fragments of more loci or content of loci. The development of markers based on larger calculations and content of loci. The development of markers based on larger calculations are content of loci. The development of markers based on larger calculations are calculated and content sequences as calculated and content sequences as calculated and content sequences of the cross celling and content content of loci. The development of markers based on larger calculated and content content

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 are arranged in the same transcriptional orientation. The nucleic acid is used to specifically express the nucleic acid of interest in vivo, particularly in the nervous system and especially expression of tyrosine hydroxylase for treatment of neurodegeneration (Parkinson's disease), nervous system injury and retinal degeneration. More generally, it can be used to express a very wide range of therapeutic products, e.g. enzymes, blood factors, cytokines, tumour suppressors, antibodies etc., for (immuno) therapy of infections, cancer, autoimmune diseases, restenosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The specification describes a nucleic acid which comprises a region (R1) encoding the transactivator (tTA) of the tetracycline-regulated system, controlled by a moderate promoter; and a region (R2) comprising a nucleic acid of interest under control of a promoter sensitive to tTA. R1 and R2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Example; Page 24; 51pp; French
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New nucleic acid for regulating gene expression, particularly of tyrosine hydroxylase for treatment of Parkinson's disease, the gene and tetracycline transactivator.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    WPI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mallet J,

Crimer extension (SNPE) primers, and the sequences of regions flanking concludes kits for determining the presence or absence of a SNP, using the coligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC performing a single-nucleotide primer extension reaction. The CC performing a single-nucleotide primer extension reaction. The CC identity of a SNP and for genotyping nucleic acid sample by CC genotity of a SNP and for genotyping nucleic acid samples, for e.g. to CC identity of a SNP and for genotyping nucleic acid samples, for e.g. to CC assess by association analysis the genotype of an individual or group of CC individuals, having a pathological phenotypic trait suspected of being CC caused by one or more SNPs. Phenotypic traits include diseases e.g. CC osteogenesis imperfecta and acute intermittent porphyria. Phenotypic craites also include symptoms of or susceptibility to multifactorial CC diseases, including, rheumatoid arthritis, multiple sclerosis, inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and contentive analysis are received.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes the human enolpyruvate phosphate-dependent glycophosphotransferase 9 protein (1). (1) has cytostatic, antiinflammatory, haemostatic, immunomodulatory and anti-HIV activities. (I) and the polynucleotide encoding it are applicable in the diagnosis and treatment of malignant neoplasm, haemostatly, HIV infection, immunological diseases and various inflammations. The present sequence represents a PCR primer for human enolpyruvate phosphate-dependent glycophosphotransferase 9, which is used in an example from the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mao

                                            The invention relates to human TFIID subunit p30beta protein 12.54, the polynucleotide encoding this polypeptide and DNA recombinant processes to produce the polypeptide. The present invention also discloses the method of applying the polypeptide in treating various diseases, such as protein metabolism dysfunction, various tumours, inflammations and immunological diseases, haemopathy and HIV infection. The present invention also discloses the antagonist for resisting the polypeptide and its treatment effect. The present invention also discloses the application of the polypurcleotide for encoding human TFIID subunit p30beta protein 12.54.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; TFIID subunit p30beta protein 12.54; tumour; protein metabolism dysfunction; immunological diseas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The polypeptide and encoded polynucleotide are applicable in diagnosis and treatment of malignant tumour, haemopathy, HIV infection, immunological diseases and various inflammations. The present sequence that of a human RNA helicase 10 PCR primer, useful to the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; dipeptidyl peptidase; DPP; neoplasia; type II diabetes; cirrhosis; autoimmunity; human immuno deficiency virus; HIV infection; cytostatic; graft rejection; antidiabetic; antiinflammatory; immunosuppressive; antiviral; enzyme; reverse transcription; RT-PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to dipeptidyl peptidase (DPP) proteins and polynucleotides encoding such proteins. The DPP peptides are useful for screening inhibitors of DPP catalytic activity. The inhibitors are useful for treating neoplasia, type II diabetes, cirrhosis, autoimmunity, graft rejection and HIV (human immuno deficiency virus) infection. The present DNA sequence is a reverse transcription (RT)-PCR primer which is used for amplifying human GDD DNA. This sequence is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New dipeptidyl peptidase (DPP) peptides, useful for screening inhibitors of DPP catalytic activity, which may be employed to treat e.g. neoplasia. type II diabetes, cirrhosis, autoimmunity, graft rejection and HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human GDD DNA amplifying reverse RT-PCR primer, GDDpr-4r.

Also described is the application of the said polypeptide in treating diseases such as osteoma and leukaemia; the antagonist against this polypeptide and its therapeutic action; and the application of the said polypucleotide encoding this novel polypeptide. The present sequence represents a reverse transcriptase (RT)-PCR primer used to isolate cDNA encoding human protein phosphatase 2A alpha subunit 22. 66.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           more bases that are perfectly matching to a sequence anywhere of the first primer or the second primer, and the first primer at its 3' end does not contain eleven or more bases that are perfectly matching except one mismatch to a sequence anywhere of the first primer or the second primer. The method is useful for designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase amplification in the sales useful in the identification of multiple genes related to multifactorial diseases, the genome-scale detection of genetic alterations, the studies in pharmacogenetic reactions, the genotyping genetic polymorphisms in a large population, the gene expression profiling in various samples and high throughput genotyping technologies. This sequence corresponds to an example of a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           amplification of target DNA fragments in a single multiplex polymerase chain reaction by aligning a first primer and a second primer. The method comprises: (a) aligning a first primer and a second primer; and (b) selecting the first primer where the first primer at its 3' end does not contain four or more bases that are perfectly matching to the 3' end sequence of the first primer or a second primer; the first primer at its 3' end does not contain seven or more bases that are perfectly matching except one mismatch to the 3' end sequence of the first primer or the second primer; the first primer at its 3' end does not contain six or second primer; the first primer at its 3' end does not contain six or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase chain reaction, for high throughput multiplex DNA sequence amplification, comprises aligning two primers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Li H,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   07-OCT-2002; 2002US-0417009P
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      07-OCT-2003; 2003WO-US031874

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is a PCR primer for an androgen-regulated, prostate specific gene PCGEM1 (prostate cancer gene expression marker 1). The PCGEM1 gene is over-expressed in prostate cancer. The PCGEM1 polymucleotide is useful for detecting prostate cancer in a patient. The PCGEM1 promoter may be linked to cytotoxic gene, and be used for selectively killing prostate cancer cells. The PCGEM1 polymucleotide is also useful as marker of prostate cancer and other prostate related diseases, as targets for therapeutic intervention in prostate cancer and other prostate related diseases, in detection, diagnosis, prognosis, prevention, and treatment of prostate cancer (e.g. prostatic intrappithelial neoplasia (PIN), adenocarcinomas, nodular hyperplasia, intrappithelial neoplasia (PIN), adenocarcinomas, nodular hyperplasia, intrappithelial neoplasia (PIN), adenocarcinomas, nodular hyperplasia, intrappithelial neoplasia (PIN), adenocarcinomas, nodular hyperplasia,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC includes kits for determining the presence of a SNP, using the CC oligonucleotides of the invention. The PCR primers are used to amplify a CC SNP flanking sequence, the SNPE primer is used as a genotyping primer. CC The oligonucleotides are useful for genotyping a nucleic acid sample by co performing a single-nucleotide primer extension reaction. The CC oligonucleotides are useful for determining the presence, absence or cidentity of a SNP and for genotyping nucleic acid sample by conserved by association analysis the genotype of an individual or group of caused by one or more SNPs. Phenotypic traits include diseases e.g. CC agammaglobulinaemia, diabetes insipidus, Lasch-Wyhan syndrome, muscular cystrophy, familial hypercholesterolaemia, polycystic kidney disease, cc asteogenesis imperfecta and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial cdisease of which a component is or may be genetic such as autoimmune confidence, including, rheumatoid arthritis, multiple sclerosis, confidence, including, rheumatoid arthritis, multiple sclerosis, machod is also useful in forensic investigations and cc miscorganism. The method is also useful in forensic investigations and cc for a human SNP containing DNA sequence represents a PCR primer specific for a human SNP containing DNA sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

identity of a SNP and for genotyping nucleic acid samples, for e.g. to assess by association analysis the genotype of an individual or group of individuals, having a pathological phenotypic trait suspected of being caused by one or more SNPs. Phenotypic traits include diseases e.g. agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, familial hypercholesterolaemia, polycystic kidney disease, osteogenesis imperfects and acute intermittent porphyria. Phenotypic traits also include symptoms of or susceptibility to multifactorial disease of which a component is or may be genetic such as autoimmune diseases, including, rheumatoid arthritis, multiple sclerosis,
                                                                                                                                                                                                                                                                                                                                                                                                                          Sequences AAH37205 - AAH40944 represent PCR primers, single nucleotide primer extension (SNPE) primers, and the sequences of regions flanking sites of single nucleotide polymorphisms SNPs. The present invention includes kits for determining the presence or absence of a SNP, using the oligonucleotides of the invention. The PCR primers are used to amplify a SNP flanking sequence, the SNPE primer is used as a genotyping primer. The oligonucleotides are useful for genotyping a nucleic acid sample by performing a single-nucleotide primer extension reaction. The oligonucleotides are useful for determining the presence, absence or oligonucleotides are useful for determining the presence, absence or
                                                                        inflammation, cancer, nervous system diseases and infection by pathogenic microorganism. The method is also useful in forensic investigations and paternity analysis. The present sequence represents a PCR primer specific
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New genotyping oligonucleotide, useful for detecting the presence, absence or identity of single polynucleotide polymorphism in a nucleic acid sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1; Page 56; 83pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cc performing a single-nucleotide primer extension reaction. The coligonucleotides are useful for determining the presence, absence or cc identity of a SNP and for genotyping nucleic acid samples, for e.g. to casses by association analysis the genotype of an individual or group of cindividuals, having a pathological phenotypic trait suspected of being cc caused by one or more SNPs. Phenotypic traits include diseases e.g. cc agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular cc dystrophy, familial hypercholesterolaemia, polycystic kidney disease, cc disease of which a component is or may be genetic such as autoimmune cc diseases, including, rheumatoid arthritis, multiple sclerosis, cc inflammation, cancer, nervous system diseases and infection by pathogenic confidence in the stigations and cc microorganism. The method is also useful in forensic investigations and cc for a human SNP containing DNA sequence represents a PCR primer specific for a human SNP containing DNA sequence

The present sequence is one such oligonucleotide. The oligonucleotides can be used if forensics, paternity testing, correlation of polymorphisms with phenotypic traits, genetic mapping of phenotypic traits and marker assisted breeding of animals and crop plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New polymorphic sites derived from the human genome are useful to determine sites correlating with phenotypic traits, particularly and also in forensics and paternity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Au Κ,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to human oligonucleotides comprising a single nucleotide polymorphic site (SNP: AAH8977-AAH89219). The present sequence is one such oligonucleotide. The oligonucleotides can be used forensics, paternity testing, correlation of polymorphisms with phenotypic traits, genetic mapping of phenotypic traits and marker assisted breeding of animals and crop plants
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polymorphic sites derived from the humar determine sites correlating with phenotypic and also in forensics and paternity testing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ąu

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Query Match
                                                                                                                                                          allelic variant polynucleotide. The polypeptides of the invention have neuroleptic activity. The polynucleotides may have a use in gene therapy. DISC1 or DISC2 nucleic acid molecules are useful for disgnosting or treating a subject having a disease or disorder associated with specific DISC1 or DISC2 alleles and/or abstrant DISC1 expression or activity e.g. neuropsychiatric disorder such as schizoaffective, bipolar, unipolar affective or adolescent conduct disorder or schizophrenia. Similarly, the
                                                                                                                         compound that inhibits DISC1 protein activity may be used in the method for treating such neuropsychiatric disorders. The sequences shown in ABQ93575-ABQ93658 represent the PCR primers used in the invention to
                                                                                                                                                                                                                                                                                      New human Disrupted-In-Schizophrenia (DISC) 1 and DISC2 single nucleotide polymorphisms, useful for preventing neuropsychiatric disorders e.g. schizophrenia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       genotyping oligonucleotide

RESULT 600
Caryl hydrocarbon (AHR), aryl hydrocarbon receptor nuclear translocator (C (ARNT), cathepsin S (CTSS), cyclooxgenase 2 (COX2), diazepam binding C (inhibitor (DBI), epoxide hydroxylase 2 (EPHX2), 5-lipoxygenase activating C protein (FLAP), glutathione-S-transferase 12 (GST12), histamine-N-methyl C transferase (HNWT), (Kallikrein 2) KLK2, nicotinamide -N-methyl C transferase (NNWT), MADPH quinnone oxidoreductase 2 (NQC2), c transferase (NNWT), NADPH quinnone oxidoreductase 2 (NQC2), c transferase (NUNT), NADPH quinnone oxidoreductase 2 (NQC2), c transferase (NCTSB1), UDP-glucuronosyl transferase 2B4 (UGT2B4), UDP-glucuronosyl transferase 2B7 (UGT2B7), UDP-glucuronosyl c transferase (UGT2B1), urokinase receptor (NPA), multidrug resistance 1 (MRP3), lactotransferrin (LTF), multidrug resistance associated protein 3 (MRP3), orphan nuclear receptor (NR112), or acetylcholine muscarinic C receptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2, CHMR3, CHMR4 or CHMR5) sequence. C The polymorphisms in the human genes cited in the invention are useful as C genetic linkage markers for locating and characterising the genes that C are responsible for specific traits within the genome and eventually cidentifying the genes responsible for a variety of disorder-related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Whuman; ds; cytochrome P450 A1; CYP4501A1; UGT2B4; MDR1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            맑
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC expression, mutation or underexpression, which may be used in diagnosing cc and/or treating the disorders. The nucleic acid molecules comprising the CC polymorphic sequences contained in CYP4501A1, CYP94501A2, CYP4502E1, CC ARNT, EBHXZ, GST12, NMMT, NQO2, NRII2, STM, UGT2B4, UGT2B7, UGT2B15, AHR, CC ARNT, and/or MDR3 are useful for screening individuals for altered drug cc metabolism. The polymorphic sequences contained in CYP4501A1, CYP94501A2, CC susceptibility to cancer. Polymorphic sequences in ADRB1 or CHMR2 are CC used to screen for altered cardiovascular function, in CMX2 for altered central nervous system function, in FLAP and HNMT for altered serine cc immunological or haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and peripheral nervous system function. The present sequence represents a cc peripheral nervous system function. The present sequence represents a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

A microarray of the invention is useful for determining if a patient has cancer, or is at increased risk of developing cancer, by hybridising a nucleic acid sample to the nucleic acid sequences from the array, and detecting the presence of mutations in FA/BRCA pathway genes in the nucleic acid sample from the patient, where detecting the presence of mutations is indicative of a patient who has cancer, or is at increased risk of developing cancer. A method of the invention is useful for screening a chemosensitising agent, and the agent obtained is useful for treating a patient having a cancer. The present sequence is used in the exemplification of the invention.
The invention relates to an isolated nucleic acid (N1) comprising at least 20 but not more than 1500 consecutive nucleotides of the optineurin promoter appearing as ADE13890. Also included are the optineurin promoter operably linked to a heterologous nucleic acid, a nucleic acid capable of detecting a single nucleotide polymorphism (SNP) in the optineurin promoter, a host cell comprising the promoter operably linked to a heterologous sequence, diagnosing or promoter a sequence, diagnosing or promoter a cell or bodily fluid (comprising detecting a polymorphism in a promoter region of the optineurin gene, associated with a glaucoma phenotype), detecting a SNP sequence variation in a sample containing
                                                                                                                                                                                                                                                                                                                                                                                                                                                 New nucleic acid sequences of the optineurin gene are useful to detect polymorphisms particularly single nucleotide polymorphisms in the optineurin promoter to diagnose, prognose and treat glaucoma and related
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         06-MAR-2002; 2002US-00091281.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            09-OCT-2003

```

The present sequence represents a non-nucleotide probe. The probe is useful for suppressing the binding of one or more detectable nucleic acid probes, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more undesired sequences in an assay for determining target genomic nucleic acid of a sample. The method comprises contacting the sample with the mixture of probes (preferably comprising 5-50 probes), contacting the sample with the one or more detectable nucleic acid probes, and determining the target genomic nucleic acid of the sample by determining the hybridization of the one or more detectable nucleic acid probes to the target genomic nucleic acid of the sample by determining the hybridization of the one or

The invention is used to diagnose and prognose glaucoma and also to treat glaucoma related disorders. The present sequence is an optineurin promoter motif, repeat element or
                                                                                                                                                                                                                                                                                                                                                                                                                 Non-nucleotide probe for suppressing binding of detectable nucleic acid probes to undesired sequences, has aggregate nucleobase sequence homologous to randomly distributed repeat sequence of genomic nucleic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     24-SEP-2001; 2001US-0324499P

CC the sample. The genomic nucleic acid is contained in a fixed tissue or a CC cell, and the sample is metaphase spreads, interphase nucleic or nucleic found in paraffin embedded tissue material or frozen tissue sections. The CC probe is also useful in comparing a sample of genomic nucleic acid with the method comprises treating a sample of genomic nucleic acid with CC control genomic nucleic acid, which are differentially labelled, the CC array or both the sample and control genomic nucleic acid and the array with treated mixture of sample and control genomic conditions, CC contacting the array with treated mixture of sample and control genomic cut to the signals from the differential labels of the array to the signals from the differential labels of the array to the caused by hybridization of the probes to genomic nucleic acid, thus determining one or more variations in copy numbers of sequences in the control genomic nucleic acid with the relative copy numbers of substantially complete as compared with the relative copy numbers of substantially complete as compared with the relative copy numbers of substantially complete as compared with the relative copy numbers of substantially complete as compared with the relative copy numbers of substantially complete as assumed to genomic nucleic acid to be tested and the reference of nucleic acid are labelled with detectable molety such that hybridization of the genomic array is determined by determining the presence, absence, amount or location of the detectable label on the one or more genomic constant and the reference of anount or location of the detectable and the reference, absence, amount or location of the detectable label on the one or more genomic constants and comparises nucleic acid that is prepared from the one or more genomic constants and comparises nucleic acid that is prepared from the one or more genomic constants and comparises nucleic acid that is prepared from the one or more genomic constants and comparises nucleic acid that is prepared from the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   RESULT 604

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     CT The method comprises treating a sample of genomic nucleic acid and control genomic nucleic acid, which are differentially labelled, the carray or both the sample and control genomic nucleic acid and the array with the mixture of the probe under suitable hybridization conditions, contacting the array with treated mixture of sample and control genomic nucleic acid under suitable hybridization conditions, and comparing the control state of the signals from the differential labels of the array to that caused by hybridization of the probes to genomic nucleic acid, thus determining one or more variations in copy numbers of substantially contensities of the signals from the differential labels of the genomic control genomic nucleic as compared with the relative copy numbers of substantially contensitied sequences in the control. The hybridization of the genomic corresponding to the feet acid hybrid. The sample of genomic nucleic acid to be tested and the reference of the genomic nucleic acid to be tested and the reference of the genomic array is determined by determining the presence, absence, amount or location of the detertable label on the one or more genomic corresponding and array comprises nucleic acid that is prepared from the determined that is prepared from the corresponding array comprises nucleic acid that is prepared from the corresponding array comprises nucleic acid that is prepared from the corresponding array comprises nucleic acid that is prepared from the corresponding array comprises for the incention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Best Local
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   cell, and the sample is metaphase spreads, interphase nucleic acid of found in paraffin embedded tissue material or frozen tissue sections. The probe is also useful in comparing a sample of genomic nucleic acid with that of a control sample using a genomic nucleic acid with method comprises treating a sample of genomic nucleic array. The method comprises treating a sample of genomic nucleic acid array control genomic nucleic acid, which are difference acid array or both the sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       comprising 5-50 probes), contacting the sample with the one or more detectable nucleic acid probes, and determining the target genomic nucleic acid of the sample by determining the hybridization of the one more detectable nucleic acid probes to the target genomic nucleic acid the sample. The genomic nucleic acid is contained in a fixed tissue or the sample. The genomic nucleic acid is contained in a fixed tissue or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              from genomic nucleic acid, to one or more undesired sequences in an ass for determining target genomic nucleic acid of a sample. The method comprises contacting the sample with the mixture of probes (preferably

CC probes, that are greater than 100 base pairs and that have been derived
CC from genomic nucleic acid, to one or more undesired sequences in an assay
CC for determining target genomic nucleic acid of a sample. The method
CC comprising 5-50 probes), contacting the mixture of probes (preferably
CC comprising 5-50 probes), contacting the mixture of probes (preferably
CC comprising 5-50 probes), contacting the sample with the one or more
CC detectable nucleic acid probes, and determining the target genomic
CC uncleic acid of the sample by determining the hybridization of the one or
CC more detectable nucleic acid probes to the target genomic nucleic acid of
CC the sample. The genomic nucleic acid is contained in a fixed tissue or a
CC cell, and the sample is metaphase spreads, interphase nucleic acid with
CC that of a control sample using a sample of genomic nucleic acid with
CC that of a control sample using a sample of genomic nucleic acid with
CC control genomic nucleic acid, which are differentially labelled, the
CC contacting the array with treated mixture of sample and control genomic
CC contacting the array with treated mixture of sample and control genomic
CC contacting one or more variations in copy numbers of sequences in the
CC identical sequences in the control. The hybridization conditions,
CC determining one or more variations in copy numbers of substantially
CC array is determined using an intercalating dye or a detectable antibody,
CC or its fragment, that is specific for a nucleic acid hybrid.
CC array is determined using an intercalating the presence, absence,
CC arrays. The genomic array is determined by determining the presence, absence,
CC arrays to the detectable nucleic acid hybrid.
CC arrays to the detectable nucleic acid the reference of more genomic
CC arrays to the detectable nucleic acid the reference, absence,
CC arrays to the detectable label on the one or more genomic
CC arrays to the detectable nucleic aci

cc array or both the sample and control genomic nucleic acid and the array control genomic nucleic acid and the array with the sample and control genomic nucleic acid and the array with treated mixture of sample and control genomic nucleic acid under suitable hybridization conditions, and comparing the content acid of the signals from the differential labels of the array to that caused by hybridization of the probes to genomic nucleic acid, thus containing one or more variations in copy numbers of sequences in the control. The hybridization of the genomic content array to determined using an intercalating dye or a detectable antibody, cor its fragment, that is specific for a nucleic acid/nucleic acid hybrid. The sample of genomic nucleic acid to be tested and the reference of nucleic acid are labelled with detectable moiety such that hybridization of the genomic array is determined by determining the presence, absence, armount or location of the detectable holety such that hybridization of the genomic array is determined by determining the presence, absence, armount or location of the detectable noiety such that hybridization of the genomic array comprises nucleic acid that is prepared from CC arrays. The genomic array comprises nucleic acid that is prepared from CC arrays. The genomic acray comprises nucleic acid that is prepared from CC arrays. The genomic acray comprises nucleic acid that is prepared from CC arrays. The genomic acray comprises nucleic acid that is prepared from CC arrays. The genomic acray comprises nucleic acid that is prepared from CC arrays.

The genomic nucleic acid is contained in a fixed tissue or a cell, and the sample is metaphase spreads, interphase nucleic or nucleic found in paraffin embedded tissue material or frozen tissue sections. The probe is also useful in comparing a sample of genomic nucleic acid with that of a control sample using a genomic nucleic acid reference array. The method comprises treating a sample of genomic nucleic acid and control genomic nucleic acid, which are differentially labelled, the array of the that of a control cand control acide, the control genomic nucleic acid, which are differentially labelled, the
                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present sequence represents a non-nucleotide probe. The probe is useful for suppressing the binding of one or more detectable nucleic acid probes, that are greater than 100 base pairs and that have been derived from genomic nucleic acid, to one or more undesired sequences in an assay for determining target genomic nucleic acid of a sample. The method

comprises contacting the sample with the mixture of probes (preferably comprising 5-50 probes), contacting the sample with the one or more detectable nucleic acid probes, and determining the target genomic common detectable mucleic acid probes, and determining the target genomic common detectable mucleic acid probes to the target genomic nucleic acid of the sample. The genomic nucleic acid is contained in a fixed tissue or a control genomic nucleic acid is contained in a fixed tissue or a control genomic nucleic acid is contained in a fixed tissue or a control genomic nucleic acid in the sample of genomic nucleic acid with that of a control sample using a genomic nucleic acid reference array. The method comprises treating a sample of genomic nucleic acid and control genomic nucleic acid, which are differentially labelled, the array or both the sample and control genomic nucleic acid and control genomic nucleic acid under suitable hybridization conditions, contacting the array with treated mixture of sample and control genomic nucleic acid with the mixture of the signals from the differential by and comparing the control sample as compared with the relative copy numbers of sequences in the control. The hybridization of the genomic determined using an intercalating dye or a detectable antibody, or its fragment, that is specific for a nucleic acid/nucleic acid hybrid. The sample of genomic nucleic acid to be tested and the reference of nucleic acid and the reference of controls array is determined by determining the presence, absence, absence, absence, and acceptable antibody.

CC arrays. The genomic array comprises mucleic acid that is prepared from conditions of the detectable mother one or more genomic conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             non-nucleotide probe; Bacterial Artificial Chromosome clone;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Non-nucleotide probe of the invention

The present invention relates to the isolation of human nuclear factor. RappaB (NF-kappaB) associated polypeptides and polynucleotides. The NF-kappaB associated polypeptide and polynucleotide sequences are useful if preventing, treating or ameliorating various disorders including immune disorders, inflammatory disorders, cancers, disorders relating to aberrant apoptosis, hepatic disorders, hodgkin's lymphomas, haematopoietic tumours, hyper-igm syndromes, hypohidrotic ectodermal dysplasia, rimmunodeficiency, viral infections (e.g. those caused by human immunodeficiency virus (HIV), human T-cell lymphotropic virus (HTLV), hepatitis B, hepatitis C, Epstein Barr virus (EBV), influenza),
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 inflammatory disorder; apoptosis; hepatic disorder; Hodgkin's lymphom

0,

The invention relates to an isolated mammalian (e.g., human or mouse) lipase polypeptide (polyp), e.g., LPDL (I) or LPDLR polyp (II). (I) or (II) 'is useful for identifying substances which can bind with LPDL or LPDLR polyp, and for identifying a compound that affects the binding of LPDL or LPDLR polyp and an LPDL or LPDLR binding polyp. (I) or (II) or their nucleic acid is useful for identifying a compound that affects LPDL or LPDLR polyP activity or expression. (I) or (II) or their nucleic acid

The invention relates to a method of designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase chain reaction by aligning a first primer and a second primer; The method comprises: (a) aligning a first primer and a second primer; and (b) selecting the first primer where the first primer at its 3' end does not contain four or more bases that are perfectly matching to the 3' end sequence of the first primer or a second primer, the first primer at its 3' end does not contain seven or more bases that are perfectly matching except one mismatch to the 3' end sequence of the first primer or the second primer, the first primer at its 3' end does not contain save or the first primer at its 3' end does not contain sav or the second primer, the first primer at its 3' end does not contain sax or the second primer, the first primer at its 3' end does not contain sax or the second primer, the first primer at its 3' end does not contain sax or the second primer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 increased or decreased LPDL or LPDLR expression or activity in an animal, where the condition is lipse deficiency, atherosclerosis, fatty liver disease and dyslipidemias, such as hypercholesterolemia, hypertriglyceridemia, mixed (combined) dyslipidemia, lipid or lipoprotein deficient states, and/or any other tissue or plasma disorders of lipid or lipoprotein metabolism. The nucleic acid is useful for diagnosing the presence of or a predisposition for a disorder in a subject which involves detecting a germline alteration in the nucleic acid in the subject an inhibitor is useful for modulating trajlyceride activity by inhibiting expression or activity of (I) or (II). The nucleic acid is useful as a probe or primer. The present sequence is used in the

The method is useful for designing primers for simultaneous amplification of target DNA fragments in a single multiplex polymerase chain reaction. It is also useful in the identification of multiple genes related to multifactorial diseases, the genome-scale detection of genetic alterations, the studies in pharmacogenetic reactions, the genotyping genetic polymorphisms in a large population, the gene expression profiling in various samples and high throughput genotyping technologies. This sequence corresponds to an example of a primer of the invention.
                                                                The present invention describes a restriction primer for eukaryotic short interspersed repeated sequences (SINE), which has one or more additional bases that are a mismatch to, or are unrelated to, the 3'-terminal end of the SINE. The annealing temperature of the primer to the DNA sequence is kept higher than the fusion temperature of the primer during polymerase chain reaction (PCR). The PCR fragments obtained are subjected to electrophoresis to obtain a fingerprint. By comparing the polymorphs from the electrophoresis band pattern, eukaryotic individuals are distinguished. The primer is used for amplifying a eukaryotic deoxyribonucleic acid (DNA) sequence, pinched between SINE sequences by polymerase chain reaction (PCR) fingerprinting. In particular it may be used individual identification of humans for medical and legal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; short interspersed repetitive element; SINE; PCR; primer; Oncorhynchus; restriction primer; short interspersed repeated sequence; eukaryote; restricted polymerase chain reaction fingerprinting; identification; DNA specimen; discrimination; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 21

                                     The present invention describes a restriction primer for eukaryotic short characteristic interspersed repeated sequences (SINE), which has one or more additional bases that are a mismatch to, or are unrelated to, the 3'-terminal end of the SINE. The annealing temperature of the primer to the DNA sequence is chain reaction (PCR). The PCR fragments obtained are subjected to celectrophoresis to obtain a fingerprint. By comparing the polymorphs from the electrophoresis band pattern, eukaryotic individuals are decoxyribonucleic acid (DNA) sequence, pinched between SINE sequences by colymerase chain reaction (PCR) fingerprinting, In particular it may be used individual identification of humans for medical and legal capplications and ecological studies. DNA specimens in traces applications and ecological studies. DNA specimens in traces of eukaryotes using the primer in a polymerase chain reaction (PCR). Co feukaryotes using the primer in a polymerase chain reaction (PCR).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Matches

                                                                                                                                                                      the electrophoresis band pattern, eukaryotic individuals are distinguished. The primer is used for amplifying a eukaryotic destyribonucleic acid (DNA) sequence, pinched between SINE sequences by polymerase chain reaction (PCR) fingerprinting. In particular it may be used individual identification of humans for medical and legal applications and ecological studies. DNA specimens in traces (approximately 10 ng in mass) can be used for individual discrimination of eukaryotes using the primer in a polymerase chain reaction (PCR).

AAZ25143 to AAZ25191 represent specifically claimed examples of primers
                                                                                                                                                                                                                                                                                                      The present invention describes a restriction primer for eukaryotic short interspersed repeated sequences (SINE), which has one or more additional bases that are a mismatch to, or are unrelated to, the 3'-terminal end of the SINE. The annealing temperature of the primer to the DNA sequence is kept higher than the fusion temperature of the primer during polymerase chain reaction (PCR). The PCR fragments obtained are subjected to electrophoresis to obtain a fingerprint. By comparing the polymorphs from the electrophoresis band pattern, eukaryotic individuals are
                                                                                                                             Sequence 22
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Restriction primer for distinguishing individuals with short interspersed repeated sequence of eukaryotes by restricted polymerase chain reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        28-JUN-1999

                                                                                                                                밁
                                                                                                                                                            Ś
                                                                                                                                                                                                                                                             The present invention describes a restriction primer for eukaryotic short CC interspersed repeated sequences (SINE), which has one or more additional CC bases that are a mismatch to, or are unrelated to, the 3'-terminal end of CC the SINE. The annealing temperature of the primer to the DNA sequence is kept higher than the fusion temperature of the primer during polymerase CC chain reaction (PCR). The PCR fragments obtained are subjected to electrophoresis to obtain a fingerprint. By comparing the polymorphs from CC distinguished. The primer is used for amplifying a eukaryotic deoxyribonucleic acid (DNA) sequence, pinched between SINE sequences by CC polymerase chain reaction (PCR) fingerprinting. In particular it may be used individual identification of humans for medical and legal CC applications and ecological studies. DNA specimens in traces CC elekaryotes using the primer in a polymerase chain reaction (PCR).

CC ALZZ5143 to ALZ25191 represent specifically claimed examples of primers

                                                                                                                                                                                                                                                                                                                                                                                                          á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a restriction primer for eukaryotic short clinterspersed repeated sequences (SINE), which has one or more additional CC bases that are a mismatch to, or are unrelated to, the 3'-terminal end of the SINE. The annealing temperature of the primer to the DNA sequence is CC kept higher than the fusion temperature of the primer during polymerase CC chain reaction (PCR). The PCR fragments obtained are subjected to CC electrophoresis to obtain a fingerprint. By comparing the polymorphs from CC distinguished. The primer is used for amplifying a eukaryotic contained are subjected to CC deoxyribonucleic acid (DNA) sequence, pinched between SINE sequences by CC polymerase chain reaction (PCR) fingerprinting. In particular it may be used individual identification of humans for medical and legal CC applications and ecological studies. DNA specimens in traces CC (approximately 10 ng in mass) can be used for individual discrimination CC eukaryotes using the primer in a polymerase chain reaction (PCR). CC ARZ25143 to ARZ25191 represent specifically claimed examples of primers
                                                                                                                                                                                                                                                                                                                 RESULT

                                                                                                                      Ś
                                                                                                                                                                                                                                                                                                             The present invention describes a restriction primer for eukaryotic short interspersed repeated sequences (SINE), which has one or more additional CC bases that are a mismatch to, or are unrelated to, the 3'-terminal end of the SINE. The annealing temperature of the primer to the DNA sequence is cept higher than the fusion temperature of the primer during polymerase CC chain reaction (PCR). The PCR fragments obtained are subjected to complete the electrophoresis to obtain a fingerprint. By comparing the polymorphs from CC distinguished. The primer is used for amplifying a eukaryotic distinguished. The primer is used for amplifying a eukaryotic deoxyribonucleic acid (DNA) sequence, pinched between SINE sequences by colymerase chain reaction (PCR) fingerprinting. In particular it may be used individual identification of humans for medical and legal CC applications and ecological studies. DNA specimens in traces

CC deproximately 10 ng in mass) can be used for individual discrimination (PCR) in mass chain reaction (PCR)
                                                                                                                                                                          Query Match

It is used for specific detection and genotyping of CYP2B6 alleles in humans, determination of which is useful for the optimisation of therapies utilising CYP2B6 substrates. Oligonucleotide sequences are useful in detection of the individual predisposition to several common cancers caused by environmental carcinogens, and diseases treated with drugs that are targets of the CYP2B6 gene product, whose metabolism is therefore dependent on CYP2B6. Cancer or susceptibility to cancer can be diagnosed by detecting the presence of a molecular variant of CYP2B6. From variants of the alleles, modulators of the activity can be developed for use in treatment and prevention of CYP2B6-related

The LXR gene product may be used in an assay to identify compounds useful for the treatment of a disease or condition selected a lower than normal HDL cholesterol level, a higher than normal triglyceride level, and a cardiovascular disease
                                                       The invention relates to a method for the amplification of DNA that maintains genes and copy number of the sequence. This method is useful for easy and operable amplification of DNA. The method was carried out by fragmentation genomic DNA, preparation of blunt end of the fragmented DNA, ligation of an adapter to the blunted DNA, PCR of the ligated DNA in 2 steps, and confirmation of the amplified APC gene. The current sequence represents a PCR primer used in an example from the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (TAKA-)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAQ73576 standard; DNA; 24
                                                                                                                                            This enhancer element is part of a DNA construct used for treating human carcinoma which contains a cancer therapeutic protein under the control of a promoter and 3 enhancer sequences in a specific 5'-3' order. This enhancer element is derived from the flanking region of the human epithelial cell cytokeratin-8 gene. (Updated on 25-MAR-2003 to correct Pi
